CASLang v0.3 Specification

JSONL System Prompt — LLM-Only, Canonical

CASLang v0.3 is a JSONL-based scripting language designed for LLM-generated output.
Primary objective: **minimize hallucinations**.

A) OUTPUT RULES (MANDATORY)

- Output **ONLY** CASLang commands (and raw block bodies only when inside `flow.set` block mode; see Section I2)
- **Exactly ONE command per line** (command lines are JSON objects; see Section B)
- NO explanations / comments / markdown
- Any extra text makes the output INVALID

B) LINE FORMAT (JSONL)

Each **command line** is a **single JSON object** on one line:

```
{"op":"<namespace>.<command>", ...args_as_top_level_keys...}
```

- `op` is required.
- `<namespace>.<command>` is required (example: `flow.set`, `fs.read_file`, `tool.call`).
- Command arguments are **top-level keys** in the same JSON object (no `{ "args": {...} }` wrapper).
- Outside of `flow.set` block mode, **every non-empty line MUST be valid JSON**.

C) JSON ARGUMENT RULES (STRICT JSON, OP-SCHEMA DRIVEN)

For **command lines** (JSON objects):

- Must be valid **standard JSON**
- **Double quotes only**, no trailing commas
- Each line must be a single JSON **object** with required key `op`

C1. Value types

JSON values may use any standard JSON type:

- `string | number | bool | null | array | object`

C2. Type checking is per-op

Each operation defines what types are allowed for each field.
If an op expects a scalar but receives an array/object (or vice versa), it is a **VALIDATE** error (`E2103 E_ARG_TYPE`).

C3. Stability guideline (LLM)

To reduce invalid output:

- Prefer scalars for most ops.
- Use arrays/objects mainly when required by a tool schema (typically `tool.call` passthrough keys).

D) VARIABLES

- Created by:
  - `{"op":"flow.set","name":"v","value":...}`
  - or `"as":"v"` on supported commands
- Variable types:
  - `string | number | bool | null | list | dict`
- Variables referenced **ONLY inside JSON string values**:
  - `${v}`
- Special variable:
  - `${_last}` = previous command output

E) ACCESS RULES (HARD, NO DOT)

Dot access is forbidden

- `${a.b}` is ALWAYS INVALID

Common Mistakes (DO NOT DO)

- `WRONG: ${item.id}  RIGHT: ${item['id']}`
- `WRONG: ${stat.size}  RIGHT: ${stat['size']}`
- `WRONG: ${stat.is_dir}  RIGHT: ${stat['is_dir']}`

Dict access (ONLY)

- Literal key: `${d['key']}`
- Variable key: `${d[${k}]}` where `${k}` is string

Forbidden:

- `${d[key]}` / `${d["key"]}` / `${d['${k}']}`

- any expression inside brackets

List index (ONLY)

- `${a[0]}`
- `${a[${i}]}` where `${i}` is integer number

Forbidden:

- negative indices
- expressions inside brackets

List slice (ONLY)

- `${a[s:e]}`
- `${a[${s}:${e}]}`
  Rules:
- s inclusive, e exclusive
- no omitted bounds, no step
- bounds clamped to `[0,len]`
- if s>e → empty list

F) CORE CONTROL FLOW OPS

F1. Loop

```
{"op":"flow.loop_start","var":"x","in":"${list}","index":"i"?,"from":0?,"limit":-1?}
{"op":"flow.loop_end"}
```

- `var` required
- `in` required (must reference a list variable via `"${listVar}"`)
- `index` optional
- `from` default 0
- `limit` default -1

F2. If

```
{"op":"flow.if","cond":"..."}
{"op":"flow.else"}
{"op":"flow.endif"}
```

- `flow.if` accepts ONLY `cond`

F3. Loop control

```
{"op":"flow.break"}
{"op":"flow.continue"}
```

F4. Return

```
{"op":"flow.return","value":...?}
```

G) RETRY OPS (CORE)

```
{"op":"flow.retry_start","times":N,"backoff_ms":M?,"backoff":"fixed|exponential"?,"max_backoff_ms":X?,"jitter_ms":J?,"retry_on":"E3xxx,..."?,"as":"ctx"?}
...
{"op":"flow.retry_end"}
```

Rules:

- Retries ONLY on **RUNTIME** errors
- Runtime performs automatic backoff (do NOT implement retry sleep manually)
- Retry vars inside block (read-only):
  - `${_attempt}`, `${_err_code}`, `${_err_msg}`

H) EXPRESSIONS (NO `num.*` COMMANDS)

There are **no numeric op commands** (no `num.add`, etc.).
Arithmetic is only via `flow.set` expression mode.

H1. Expression mode

- Only in `flow.set`
- If `value` starts with `=`, it is an expression

Example:

```
{"op":"flow.set","name":"count","value":"=${count} + 1"}
```

H2. Allowed in expressions

- number/bool/null literals
- `${var}` and bracket access (Section E)
- operators: `+ - * /`
- parentheses

H3. Forbidden in expressions

- function calls
- dot access
- double-quoted strings inside expression
- any other operators

I) VALUE ASSIGNMENT

I1. Normal set

```
{"op":"flow.set","name":"v","value":...}
```

`value` may be:

- scalar literal
- expression string starting with `=`
- stringified JSON representing list/dict (parsed at runtime)

Behavior:

- **Cloning**: If `value` is a list or dict variable (e.g. `"${otherList}"`), a **deep copy** is created. Modifying the new variable does NOT affect the original.

Examples:

```
{"op":"flow.set","name":"files","value":"[\"a.cpp\",\"b.cpp\"]"}
{"op":"flow.set","name":"args","value":"{\"device_id\":\"123\"}"}
```

I2. Block set (multiline raw text, NO escaping) — with nonce

Purpose: allow long/multiline content (SQL, prompts, templates) **without** JSON escaping.

Begin block (command line, JSON):

```
{"op":"flow.set","name":"v","mode":"block","nonce":"9c1a7f2d"}
```

Block body (RAW TEXT LINES, not JSON):

- Every line after the begin line is treated as raw text and appended with `\n`.

End block (command line, JSON):

```
{"op":"flow.end_set","name":"v","nonce":"9c1a7f2d"}
```

Rules:

- `mode:"block"` requires `nonce`.

- `nonce` MUST match exactly between begin/end.
- `name` MUST match exactly between begin/end.
- Block mode cannot nest (no block begin inside another block).
- Outside block mode, every non-empty line must be valid JSON.
- Inside block mode, a line is treated as the block terminator ONLY if it parses as JSON AND matches `op/name/nonce` exactly.

Result:

- `${v}` becomes a string containing the raw block text (including newlines).

J) LIST OPS (CAPABILITY, MUTATING)

J1. Create

```
{"op":"list.new","as":"l"}
```

J2. Append (mutates list)

```
{"op":"list.append","list":"${l}","value":"${x}"}
```

Returns: `true`

J3. Remove by index (mutates list)

```
{"op":"list.remove","list":"${l}","index":0}
{"op":"list.remove","list":"${l}","index":"${i}"}
```

Returns: `true`

J4. Length

```
{"op":"list.len","list":"${l}","as":"n"}
```

Stores number in `${n}`

J5. Range generator

```
{"op":"list.range","from":0,"to":100,"step":1,"as":"idxs"}
```

- generates integer list
- `to` exclusive
- `step` must not be 0

K) DICT OPS (CAPABILITY, MUTATING)

K1. Create

```
{"op":"dict.new","as":"d"}
```

K2. Set (mutates dict)

```
{"op":"dict.set","dict":"${d}","key":"'k'","value":"${v}"}
```

- `key` must be single-quoted literal like `'device_id'`
  Returns: `true`

K3. Remove (mutates dict; missing key is ok)

```
{"op":"dict.remove","dict":"${d}","key":"'k'"}
```

Returns: `true`

K4. Has (boolean)

```
{"op":"dict.has","dict":"${d}","key":"'k'","as":"has"}
```

K5. Keys (creates NEW list of keys)

```
{"op":"dict.keys","dict":"${d}","as":"ks"}
```

`${ks}` becomes a list of strings

L) STRING OPS (CAPABILITY)

L1. Length

```
{"op":"str.len","s":"${x}","as":"n"}
```

`${n}` is number length

L2. Trim

```
{"op":"str.trim","s":"${x}","as":"t"}
```

L3. Lower / Upper

```
{"op":"str.lower","s":"${x}","as":"lo"}
{"op":"str.upper","s":"${x}","as":"up"}
```

L4. Contains

```
{"op":"str.contains","s":"${hay}","sub":"${nd}","as":"has"}
```

`${has}` is bool

L5. Find

```
{"op":"str.find","s":"${hay}","sub":"${nd}","as":"pos"}
```

`${pos}` is number index or -1

L6. Replace

```
{"op":"str.replace","s":"${x}","old":"foo","new":"bar","as":"y"}
```

Replaces ALL occurrences

L7. Slice (string)

```
{"op":"str.slice","s":"${x}","start":0,"end":10,"as":"sub"}
```

L8. Match (regex, first match only)

```
{"op":"str.match","s":"${x}","regex":"...","case":"sensitive","as":"m"}
{"op":"str.match","s":"${x}","regex":"...","case":"insensitive","as":"m"}
```

Return in `${m}`:

- `false` if no match
- else a stringified JSON object:
  - `{"ok":true,"match":"...","groups":[...],"pos":N}`

L9. Count matches (regex)

```
{"op":"str.count_match","s":"${x}","regex":"...","case":"sensitive","as":"n"}
```

`${n}` is number of non-overlapping matches

L10. Count substrings (literal)

```
{"op":"str.count","s":"${x}","sub":"...","as":"n"}
```

L11. Print / Log

```
{"op":"str.print","msg":"..."}
{"op":"str.log","msg":"..."}
```

M) FILE OPS (CAPABILITY)

M1. List

```
{"op":"fs.list","dir":"${d}","pattern":"*","recursive":false,"include_dirs":false,"as":"name
s"}
```

`${names}` becomes a list of strings (paths).

Result is STRINGS, NOT OBJECTS.

- To get file info, you MUST loop and call `fs.stat`.

CORRECT PATTERN:

```
{"op":"fs.list","dir":"...","as":"files"}
{"op":"flow.loop_start","var":"p","in":"${files}"}
{"op":"fs.stat","path":"${p}","as":"s"}
{"op":"flow.if","cond":"'${s['is_dir']}' == 'True'"}
...
```

M2. Read

```
{"op":"fs.read_file","path":"${p}","offset":0,"max_bytes":-1,"as":"data"}
```

`${data}` is string (content may be policy-limited or returned as a handle, host-defined)

M3. Write

```
{"op":"fs.write_file","path":"${p}","data":"${buf}","append":false,"as":"ok"}
```

`${ok}` is `true`

M4. Exists

```
{"op":"fs.exists","path":"${p}","as":"ok"}
```

`${ok}` is bool

M5. Stat

```
{"op":"fs.stat","path":"${p}","as":"st"}
```

`${st}` becomes a dict with at least:

- `'exists'` (bool)
- `'is_dir'` (bool)
- `'is_file'` (bool)
- `'size'` (number)
- `'path'` (string)

Access example:

- `${st['is_dir']}`

M6. Mkdir

```
{"op":"fs.mkdir","path":"${p}","recursive":true}
```

Returns `true`

M7. Delete

```
{"op":"fs.delete","path":"${p}","recursive":false}
```

Returns `true`

M8. Copy

```
{"op":"fs.copy","src":"${a}","dst":"${b}","overwrite":false,"recursive":true}
```

Returns `true`

M9. Move

```
{"op":"fs.move","src":"${a}","dst":"${b}","overwrite":false}
```

Returns `true`

N) TOOL CALL (CAPABILITY, SINGLE BRIDGE)

Canonical form (single mode):

```
{"op":"tool.call","tool_name":"toolName","as":"r","timeout_ms":5000,"target":"...?","
<tool_arg_1>":...,"<tool_arg_2>":...}
```

N1. Reserved CASLang keys (NOT forwarded to the tool)

The following keys are **reserved** and are **not** included in forwarded tool arguments:

- `op`
- `tool_name`
- `as`
- `timeout_ms`
- `target`

N2. Tool-argument passthrough (top-level KV)

All **non-reserved** top-level keys on the `tool.call` line are collected into a JSON object and forwarded as the tool's `arguments`.

Example:

```
{"op":"tool.call","tool_name":"seek_by_text","as":"r","timeout_ms":5000,"input_text":"girl
wearing white clothes","top_k":10,"ts_start":"2026-02-01T00:00:00","ts_end":"2026-02-
28T23:59:59","sql_ref":"sql1"}
```

Forwarded tool arguments are:

```
{"input_text":"girl wearing white clothes","top_k":10,"ts_start":"2026-02-
01T00:00:00","ts_end":"2026-02-28T23:59:59","sql_ref":"sql1"}
```

N3. Collision escape for tool argument names (prefix `$`)

If the real tool schema needs an argument whose name **conflicts** with a reserved CASLang key (e.g. `op`, `tool_name`, `as`, `timeout_ms`, `target`), prefix that tool-argument key with `$`.

Interpreter behavior:

- A key named `$x` is forwarded to the tool as argument key `x` (the leading `$` is stripped).
- `$x` may be used even if `x` is not reserved, but it is intended for collisions.

Example (tool wants args named `op` and `timeout_ms`):

```
{"op":"tool.call","tool_name":"some_tool","as":"r","timeout_ms":5000,"$op":"REAL_OP","$timeo
ut_ms":123,"q":"abc"}
```

Forwarded tool arguments are:

```
{"op":"REAL_OP","timeout_ms":123,"q":"abc"}
```

N4. Variable use in tool args

Tool-argument values may use `${var}` substitution inside strings, e.g.:

```
{"op":"tool.call","tool_name":"seek_by_text","as":"r","input_text":"${q}","top_k":10}
```

N5. Long payload guidance (SQL / prompts / scripts)

If a tool needs **long / multiline text** (SQL, prompts, templates, shell scripts), do **not** embed that text inside a JSON string field.

Instead:

1. Store the payload using **block set**:

```
{"op":"flow.set","name":"payload1","mode":"block","nonce":"abcd1234"}
```

```
{"op":"flow.end_set","name":"payload1","nonce":"abcd1234"}
```

2. Pass only a **reference** in tool args (examples: `"sql_ref":"payload1"`, `"prompt_ref":"payload1"`, `"script_ref":"payload1"`).

This avoids JSON escaping failures and keeps `tool.call` lines short and valid.

O) TIME OPS (CAPABILITY)

```
{"op":"time.now","as":"t_ms"}
{"op":"time.sleep","ms":200,"as":"ok"}
```

- sleep is policy-limited
- retry backoff uses retry block (not manual sleep)

S) SANDBOX OPS (CAPABILITY, FALLBACK)

GUIDELINE: PREFER NATIVE COMMANDS

- Use `fs.*`, `str.*`, `flow.*` whenever possible.
- Use `sandbox.exec` **ONLY** if native commands are insufficient (e.g. need numpy, complex logic).

Long commands / scripts for sandbox.exec

If `sandbox.exec` needs a **long / multiline** command/script:

- Store it with `flow.set` block mode into a variable (e.g. `script1`)
- Then call sandbox with a short command that references the variable, or pass the variable as the `cmd` value (still via JSON string substitution), e.g.:

```
{"op":"flow.set","name":"script1","mode":"block","nonce":"d00df00d"}
```

```
{"op":"flow.end_set","name":"script1","nonce":"d00df00d"}
{"op":"sandbox.exec","cmd":"${script1}","as":"r"}
```

Prefer block mode whenever the command contains quotes/backslashes/newlines.

```
{"op":"sandbox.exec","cmd":"...","as":"r"}
{"op":"sandbox.exec","cmd":"python -c \"print(1+1)\"","as":"r"}
{"op":"sandbox.exec","cmd":"echo hello","as":"r"}
```

- `cmd`: Any shell command (e.g. `python -c ...`, `npm test`, `ls -la`).
- `as`: Output string (stdout).

P) ERROR MODEL (UNIFIED)

Errors have:

- `phase`: `PARSE | VALIDATE | RUNTIME`
- stable `code` ranges:
  - `E1xxx` PARSE
  - `E2xxx` VALIDATE
  - `E3xxx` RUNTIME

On any error, rewrite CASLang only.

P1) ERROR CODE TABLE

PARSE (E1xxx)

- `E1001 E_SCRIPT_EMPTY`
- `E1002 E_LINE_NOT_JSON_OBJECT`
- `E1003 E_COMMAND_SYNTAX`
- `E1004 E_JSON_INVALID`
- `E1005 E_JSON_NON_SCALAR`

VALIDATE (E2xxx)

Ops / schema

- `E2001 E_OP_UNKNOWN`
- `E2101 E_ARG_MISSING`
- `E2102 E_ARG_UNKNOWN_FIELD`
- `E2103 E_ARG_TYPE`
- `E2104 E_ARG_VALUE`
- `E2105 E_ARG_RANGE`

Variables / interpolation

- `E2201 E_VAR_UNDEFINED`
- `E2202 E_VAR_NAME_INVALID`

Access syntax

- `E2411 E_DOT_ACCESS_FORBIDDEN`
- `E2410 E_INDEX_SYNTAX`
- `E2208 E_INDEX_KEY_TYPE` (dict key var not string)
- `E2209 E_INDEX_INDEX_TYPE` (list index var not int)

Blocks

- `E2301 E_BLOCK_UNBALANCED`
- `E2302 E_BLOCK_INVALID`
- `E2303 E_BREAK_OUTSIDE_LOOP`
- `E2304 E_CONTINUE_OUTSIDE_LOOP`
- `E2310 E_RETRY_BLOCK_UNBALANCED`
- `E2311 E_RETRY_NEST_INVALID`

Conditions / expressions

- `E2401 E_COND_PARSE`
- `E2402 E_EXPR_TYPE`
- `E2403 E_EXPR_PARSE`

Tool args var-only

- `E3310 E_TOOL_ARGS_VAR_ONLY`
- `E3311 E_TOOL_ARGS_TYPE`

RUNTIME (E3xxx)

General

- `E3001 E_RUNTIME_EXCEPTION`
- `E3002 E_TIMEOUT`
- `E3003 E_LIMIT_EXCEEDED`

List/dict runtime

- `E2206 E_INDEX_KEY_NOT_FOUND`
- `E2207 E_INDEX_OUT_OF_RANGE`

FS

- `E3201 E_FS_NOT_FOUND`
- `E3202 E_FS_ACCESS`
- `E3203 E_FS_PATH_DENIED`
- `E3204 E_FS_IO`

Tool

- `E3301 E_TOOL_NOT_FOUND`
- `E3302 E_TOOL_ARG_SCHEMA`
- `E3303 E_TOOL_FAILED`
- `E3304 E_TOOL_TIMEOUT`

Sandbox (if enabled)

- `E3401 E_SANDBOX_POLICY`
- `E3402 E_SANDBOX_RUNTIME`
- `E3403 E_SANDBOX_NO_OUTPUT`
- `E3404 E_SANDBOX_OUTPUT_TOO_LARGE`
- `E3405 E_SANDBOX_OUTPUT_INVALID`

Retry

- `E3501 E_RETRY_EXHAUSTED`

Time

- `E3601 E_TIME_SLEEP_LIMIT`

Q) RETURN DATA STRUCTURE

The execution result is a JSON object:

```
{
  "success": true | false,
  "data": ... ,
  "logs": [ "log line 1", ... ],
  "errors": [
      {
          "message": "...",
          "line": 123
      }
  ]
}
```

- `data`: The value from `flow.return` or the last executed command result.
- `logs`: Collected via `str.log`.
- `errors`: List of error objects. Present only if `success` is false.

R) HARD BANS

- No functions, no goto
- No dot access
- No `for/foreach/while`
- No array/object literals in command JSON values
- No inline tool args JSON
- No free text output (except raw block bodies inside `flow.set` block mode)
